

Secure SD-WAN

Vocus Secure SD-WAN is an integrated security, network routing and WAN optimisation solution.

An increasingly mobile workforce, transition to cloud services and cloud-based applications are all driving an urgent need for more secure and optimised WAN technologies.

Secure SD-WAN delivers next generation networking capabilities that maximise WAN efficiency without compromising on security. Included as standard are firewall, routing and SD-WAN management capability, with self service functions available via a cloud-based portal. Secure SD-WAN gives you visibility and control of your network and application traffic.

Our solution for you

Secure SD-WAN is a fully managed service offering throughput from 100 Mbps up to 2 Gbps with optional 3G/4G failover and two factor authentication. We design and implement your solution, and provide ongoing management of network and security policies, across multiple sites, for a fixed monthly fee.

With the ability to view real time statistics on network and application performance, and to centrally configure and enforce policy via a centralised cloud base interface, Secure SD-WAN delivers the real and effective benefits of better utilising your available network connections based on the priorities you set for your traffic.

| | | |
|---|---|---|
|  <p>Secure access via an on premise firewall</p> |  <p>Real time network and application performance statistics</p> |  <p>Prioritise critical applications and traffic</p> |
|  <p>Better utilise available network connections</p> |  <p>Faster connection for users via multiple links</p> |  <p>Manage network and security policies across multiple sites</p> |

Who is it for?

Secure SD-WAN is for any sized business wanting scalable management of network and security policies across multiple sites.

| | | |
|--|--|--|
| <p>Small</p>  <p>10 - 100 Staff</p> | <p>Medium</p>  <p>100 - 500 Staff</p> | <p>Large</p>  <p>500+ Staff</p> |
|--|--|--|

Features and benefits

Enhance Security

- Next generation firewall provides robust protection from breaches and malicious activity
- Secure access to web, email and applications via an on-premise firewall

Simplify Management

- Effectively manage applications over the WAN, assign prioritisation for critical applications and traffic
- Reduce the complexity and cost of dealing with multiple vendors

Improve Performance

- Leverage your existing network and better utilise your available network connections based on the priorities set for your traffic
- Business critical applications such as IP Voice, video and ERP can be routed based on application priority and network metrics such as latency, jitter and loss

Increase Efficiency

- Fast connections for users via multiple links plus the ability to add new access types
- Add new sites to the Secure SD-WAN service and easily provision the applicable configurations and policies

Improve Visibility

- Easy access to network and application performance reporting via a dedicated management portal
- View real time statistics including aggregated link speed, availability and throughput
- Ability to generate custom reports

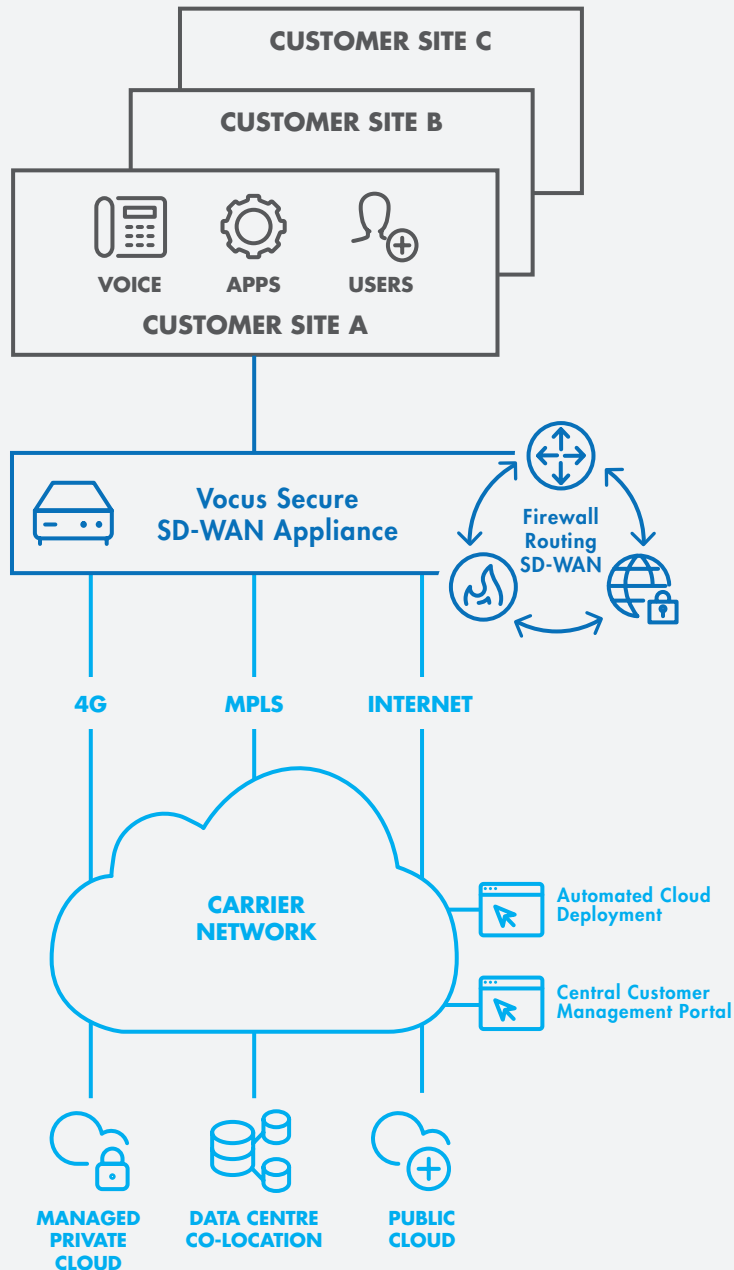

Take Control

- Centralised configuration and policy enforcement via a cloud based interface
- Better management of network and security policies across multiple sites
